

# STRONGER

than your coffee.

-  **1 Use Complex Passwords**  
Think beyond birthdays or pet names. Use a combination of uppercase and lowercase letters, numbers and symbols.
-  **2 Don't Reuse Passwords**  
Keep your passwords unique for different apps. A data leak on one website can make all your applications vulnerable.
-  **3 Leverage Password Managers**  
Remembering passwords is hard. Password managers securely store them and can even generate unique passwords for your applications.
-  **4 Enable Two-factor Authentication (2FA)**  
Even strong locks can be broken. Enable 2FA on all your cloud apps to make it harder for criminals to gain access.
-  **5 Beware of Imposters**  
Watch out for phishing emails impersonating familiar contacts. Clicking on links in these emails could put your business at risk.
